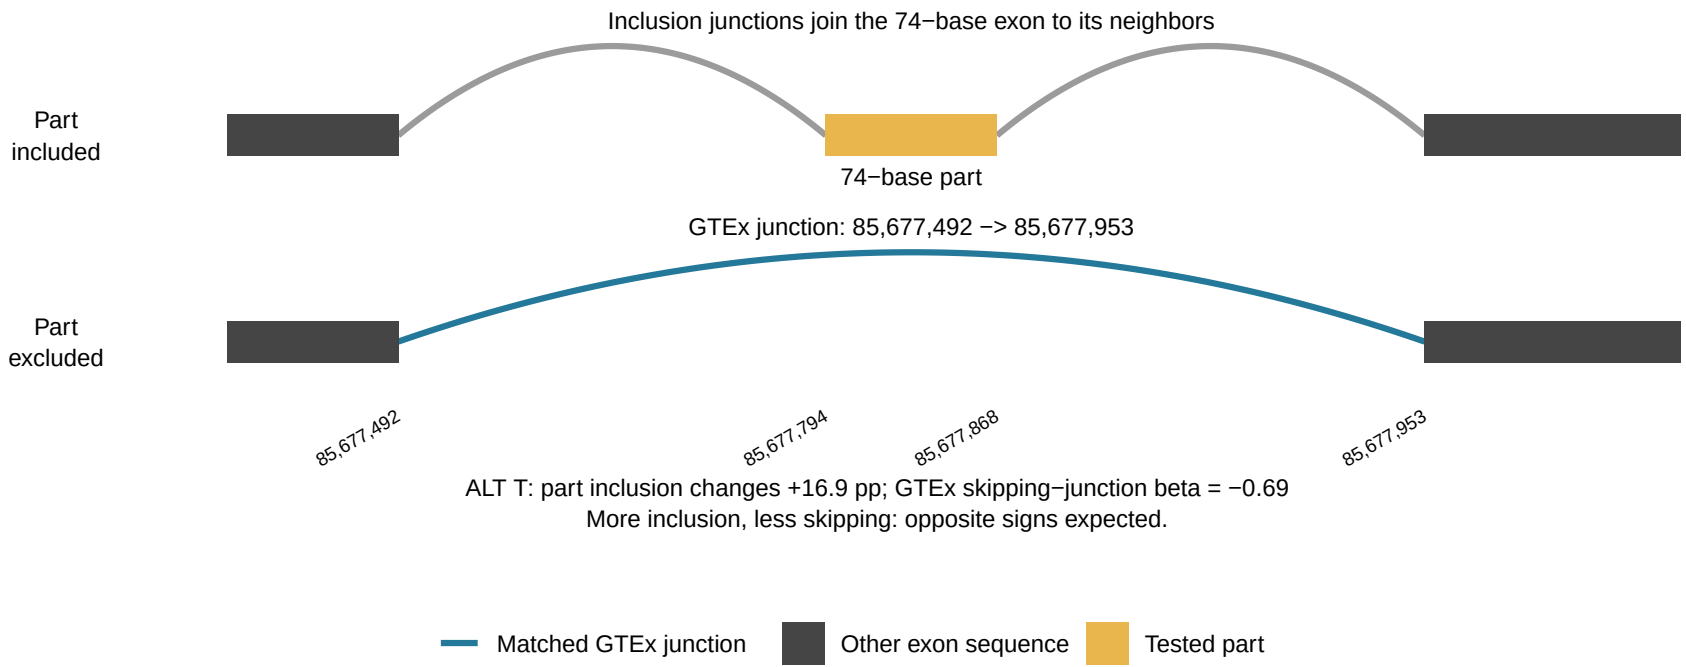
SNHG5: matching isoLASER to a Cerebellum sQTL

Same variant and gene; the GTEx junction distinguishes a local inclusion/exclusion choice for the tested part.

SNHG5: cassette exon



Schematic, not to scale. Coordinates are 0−based; genomic position increases left to right (SNHG5 is on the minus strand).
Blue: junction measured by GTEx Cerebellum. Gold: part tested by isoLASER. Effects shown at 6 hr; GTEx brain tissues are not stimulated.
