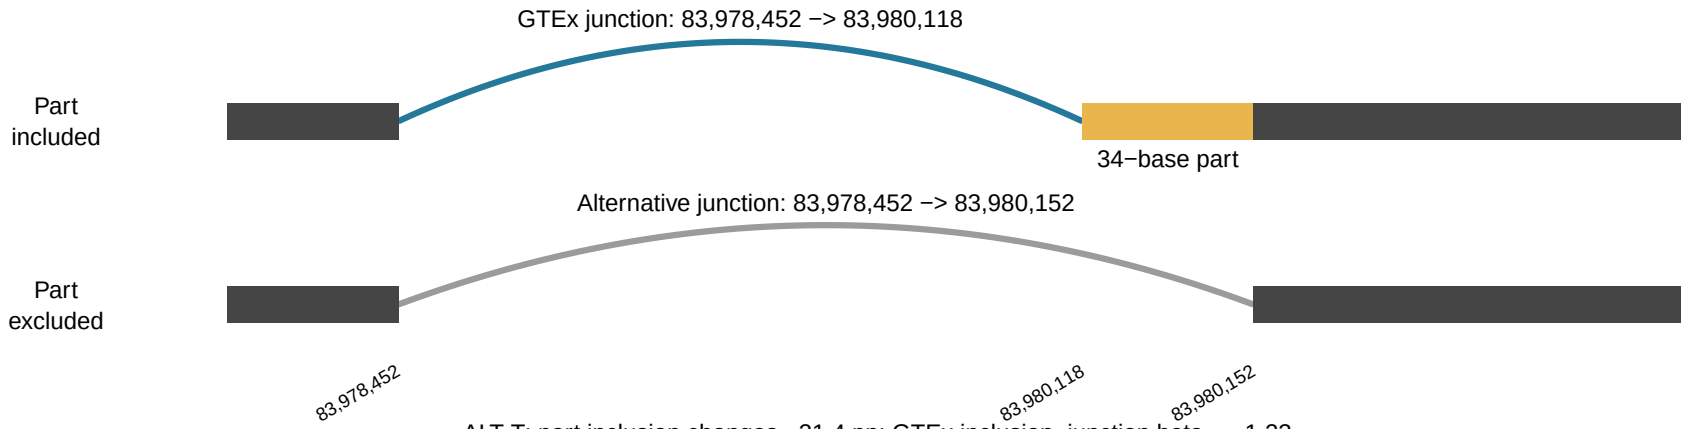
Why these isoLASER and GTEx measurements are comparable

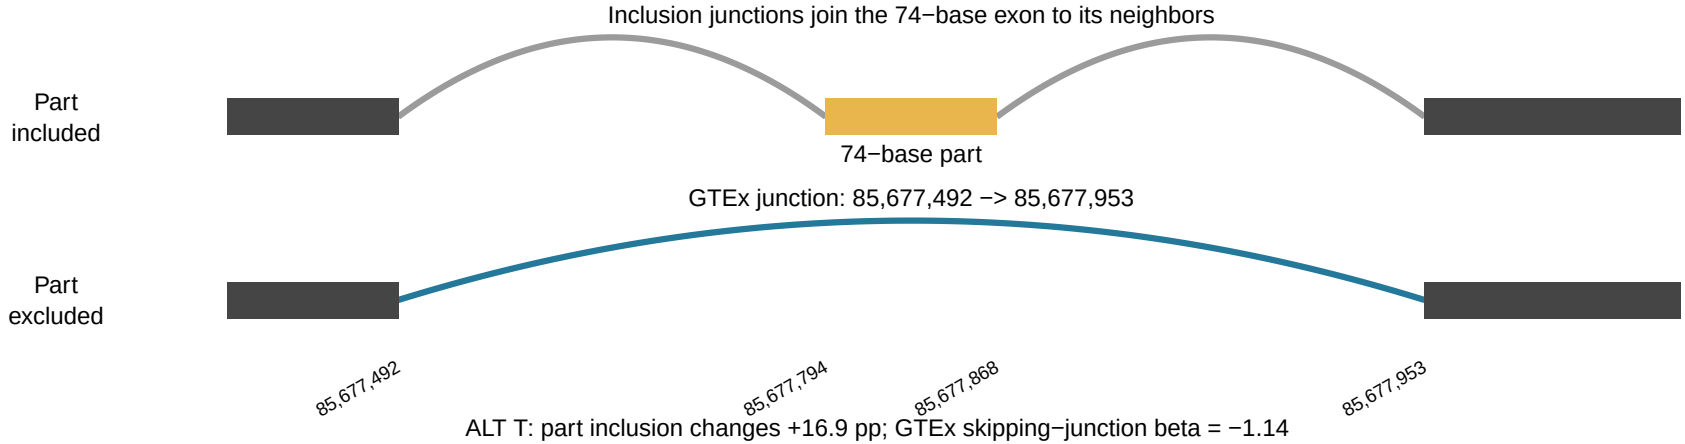
Same variant and gene; the GTEx junction distinguishes a local inclusion/exclusion choice for the tested part.

HNRNPK: alternative splice site



ALT T: part inclusion changes −21.4 pp; GTEx inclusion−junction beta = −1.23
Both decrease: same sign expected.

SNHG5: cassette exon



ALT T: part inclusion changes +16.9 pp; GTEx skipping−junction beta = −1.14
More inclusion, less skipping: opposite signs expected.

Matched GTEx junction | Other exon sequence | Tested part

Schematics, not to scale. Coordinates are 0−based; genomic position increases left to right (both genes are on the minus strand).
Blue: junction measured by GTEx. Gold: part tested by isoLASER. Effects shown at 6 hr; GTEx brain tissues are not stimulated.
Illustrates representative transcript segments; junction usage and part inclusion are related, distinct phenotypes.
