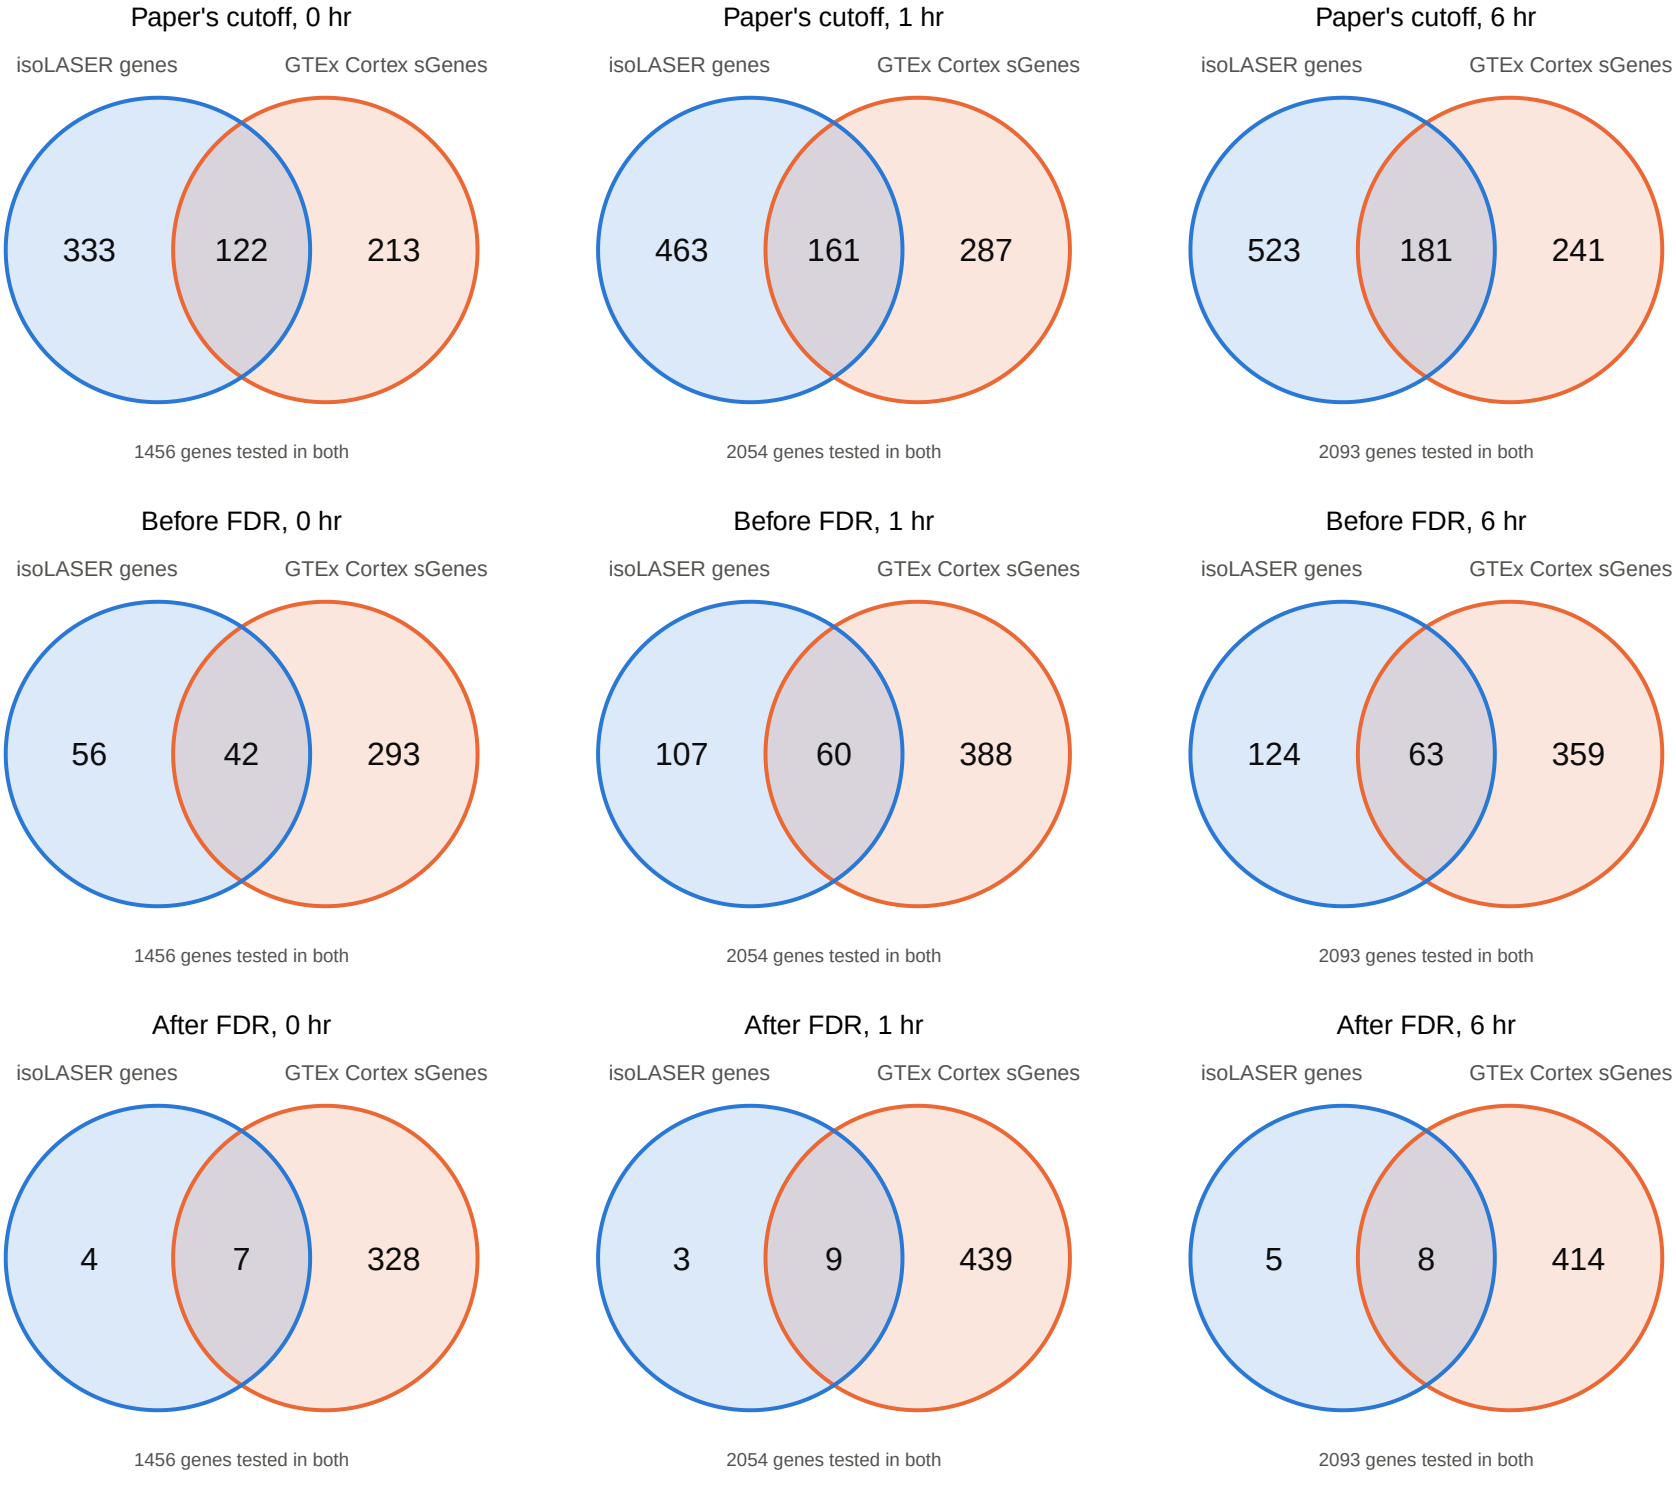
Read−based isoLASER vs GTEx Cortex sGenes, by timepoint



Each panel: one set at one timepoint, restricted to genes tested at that timepoint in our permutation run and by GTEx Cortex. isoLASER genes: at least one association of the set at that timepoint. GTEx sGenes: gene−level q < 0.05, through any variant and junction (gene level: not necessarily our SNV or event). Circles are not area−proportional.
