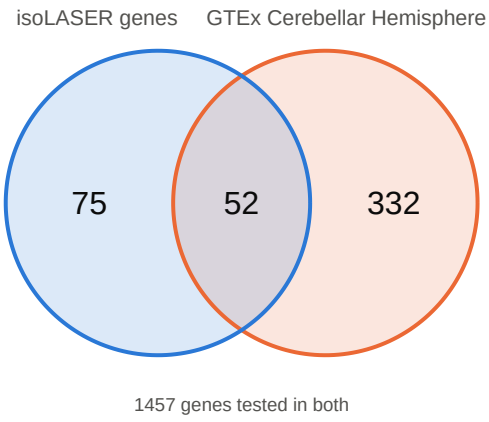
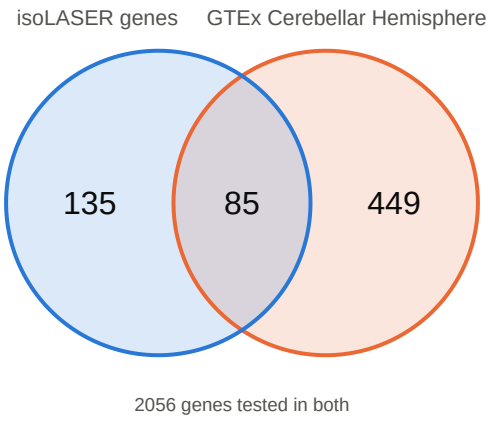
Read−based isoLASER vs GTEx Cerebellar Hemisphere sGenes, by timepoint

isoLASER cis, het donors, 0 hr



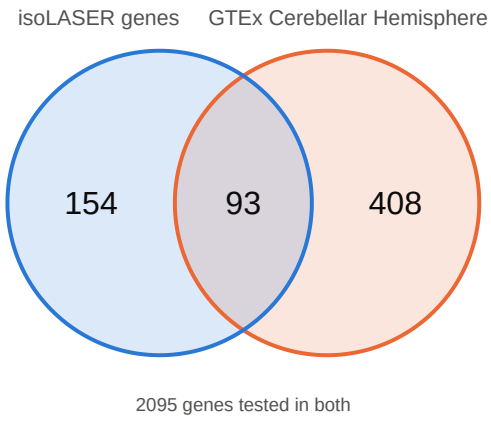
1457 genes tested in both

isoLASER cis, het donors, 1 hr



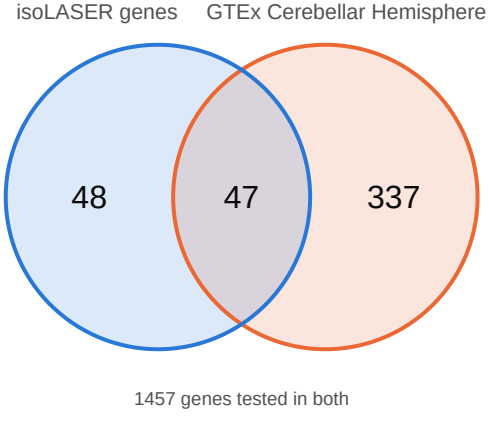
2056 genes tested in both

isoLASER cis, het donors, 6 hr



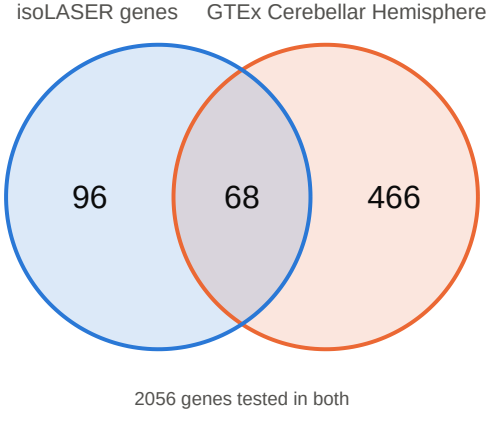
2095 genes tested in both

Before FDR, 0 hr



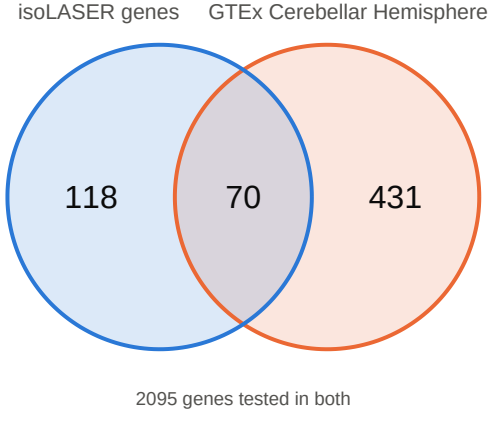
1457 genes tested in both

Before FDR, 1 hr



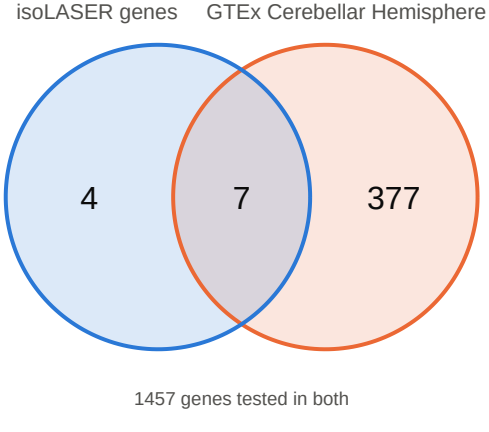
2056 genes tested in both

Before FDR, 6 hr



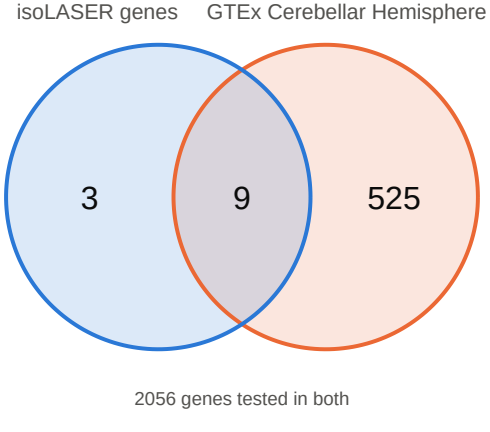
2095 genes tested in both

After FDR, 0 hr



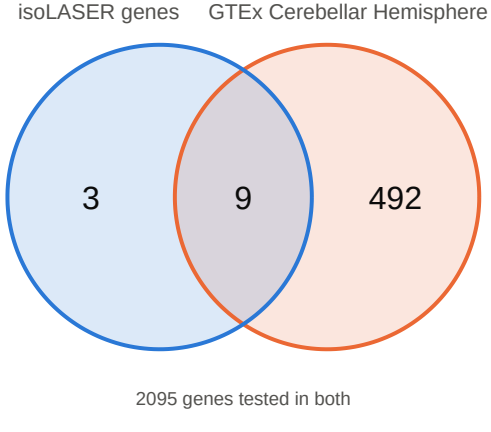
1457 genes tested in both

After FDR, 1 hr



2056 genes tested in both

After FDR, 6 hr



2095 genes tested in both

Each panel: one set at one timepoint, restricted to genes tested at that timepoint in our permutation run and by GTEx Cerebellar Hemisphere.
isoLASER genes: at least one association of the set at that timepoint. GTEx sGenes: gene−level q < 0.05, through any variant
and junction (gene level: not necessarily our SNV or event). Circles are not area−proportional.
